```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The present sequence encodes winter rye (Secale cereale L. cv. Muskateer) CHT9 preprotein (see AAW98079). Mature CHT9 (see AAW98080) is a chitimase-like protein that has chitimase (antifungal) and antifreeze activities. CHT9 cDNA (ch-9) was obtained by isolating mana from rye plants grown at low temperatures in the absence of pathogens or other stresses, i.e. under conditions when only chitimases with antifreeze activity would be expressed, and then sorting the cold-induced chitimase cDNAs to determine which encoded proteins with ice-binding ability. CHT9 and CHT46 (see AAW98081-82) corting the cold-induced chitimase cDNAs to determine which encoded proteins with ice-binding ability. CHT9 and CHT46 (see AAW98081-82) corting the cold-induced chitimase cDNAs to determine which encoded proteins and in Arabidopsis thaliana. The chitimase-like antifreeze proteins can be used: to increase freezing tolerance of plants and microorganisms; to increase field survival of plants, animals and microorganisms exposed to sub-zero temperatures; to inhibit ice crypteservation and hypothermic protection of cells, embryos, tissues etc. (particularly human plantelets) is and too kill tumour cells. They are also used to inhibit initiation and progression of diseases or spoilage caused by low temperature pathogens (particularly fungi) in plants, frozen foods and any cryopreserved
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 249

```
The sequence given represents the rice chitinase gene. The promoter region of this gene (see AAQ31407) is responsive to physical and/or biological stress. The pattern of expression of this gene in mature plants is characteristic. There is a low level of expression in roots and the male and female parts of the plant. The chitinase promoter sequence may be linked to a reporter gene for expression in mono- or dicotyledon plants. Expression of this reporter gene may be used to study patterns of development and controlled expression of plant
                                                                                                                                       DNA fragment contg. chitinase gene and its regulatory region - is responsive to mature plant stress and has low level expression in leaves, moderate level expression in stem and high level expression in roots
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 1151 BP; 197 A; 409 C; 353 G; 192 T; 0 other;

STUDIES Maher EA, (SALK) SALK INST BIOLOGICAL Lamb CJ, Dixon RA,

WPI; 1995-067090/09 P-PSDB; AAR67969 associated pathogens when Transgenic plants contg. several plant defence proteins - have increased resistance to plant grown in crops as a food source

Disclosure; Page 31-32; 45pp; English.

The SphI fragment of rice chitinase RCH10 gene (given in AAQ81346) and an alfalfa beta-1,3-qlucanase coding sequence (AAQ81347) were incorporated into vectors for co-expression in transgenic tobacco, resulting in improved resistance to Cercospora nicotinae and Thanatephorus cucumeris fungal infection. ```
The present sequence encodes a chitinase designated RCH10. The specification describes chimeric receptors which are used for modulating plant responses to pathogens. The receptors comprise a heterologous extracellular domain (e.g. from a Bril protein or RCH10 protein) and a kinase domain (e.g. from disease resistance protein Xa21). The Xa21 gene is a member of disease resistance genes referred to as RKK genes. When Xa21 is present in a transgenic plant, it confers resistance to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Xanthomonas spp. The plant receptors containing heterologous domains are useful for modulating plant responses to pathogens including viruses, bacteria, nematodes, fungi or insects. The nucleic acids can be used to

The present sequence encodes a chitinase polypeptide. The specification describes glucosyl hydrolase family 19 chitinases (AAB18894, AAB18896, AAB188995, and AAB18907-08 and AAB18900-01). The level of chitinases (AAB18895, AAB18897-98 and AAB18900-01). The level of chitinase in plants can be modulated to enhance disease resistance in crop plants and for control of pathogens. The chitinase polynucleotides are also useful
                                                                                                                                                                                                                                                                                                                          crop
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        9cc9gccac9gccgagcagtgcggctcgcaagccggcggcgaagtgcgccgactgct 128

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                827
                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                   which
                                                                                        This sequence encodes Chitinase G. Chitinase is an enzyme which breaks down chitin, the major protein in insect exoskeletons. The coding sequence may be used in the construction of transgenic organisms, especially plants, to produce pathogen resistant organisms. The genome of such transgenic organisms preferably contains more than one gene with pathogen inhibiting activity, each gene under the control of active promoters. The two gene products then show a synergistic increase in pathogen induced activity so th

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This cDNA encodes a floral organ-specific chitinase. The specification provides a promoter sequence (AAV49983) derived from rice associated with chitinase, specific to floral organs that allows expression of genes in the flower parts of monocotyledonous plants. The expression of desired genes specifically in the floral parts of monocotyledonous plants, allows modifications to be made in the structure or function of these parts allowing the introduction of desired characteristics such as increased resistance to bacterial attack.

                                                                                                                                                                                                            Recombinant DNA contg. high level promoter and plant chitinase gene - for transforming plants to over:express chitinase, imparting resistance to phytopathogenic fungi.
                                                                                                                                                                                                                                                                              Sequence encoding chitinase may be used to transform monoor dioctyledons to show increased resistance to fungal attack. A high level promoter is used from CMV 35s or 19s complement, NOS or OCS promoters of Agrobacterium opine synthetase gene, the RUBISCO small unit or the chlorophyl A/B binding protein.

```

```
This sequence represents the coding sequence for the pumpkin chitinase. Chitinase is an enzyme decomposing chitin (not present in plant cell membranes) found in the cell membranes of fungi, plants have this enzyme to protect themselves from pathogenic fungi. Thus this enzyme can be used to prevent plants from being infected with pathogenic fungi, and the chitinase gene can be introduced into plants to improve their resistance to diseases caused by fungi. As the amino acid sequence of the chitinase does not have any region to be cleaved by ubiquitous peptidases in cells, the chitinase produced by genetic recombination technology works for various host cells and serves for plant immunity to confer disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Chitinase; pumpkin; enzyme; decompose; plant cell membrane; peptidase; fungal cell membrane; pathogenic fungus; disease resistance; chitin; ss.

Chitinase is an enzyme decomposing chitin (not present in plant cell membranes) found in the cell membranes of fungi. Plants have this enzyme to protect themselves from pathogenic fungi. Thus this enzyme can be used chitinase gene can be introduced into plants to improve their resistance to diseases caused by fungi. As the amino acid sequence of the chitinase does not have any region to be cleaved by ubiquitous peptidases in cells, the chitinase produced by genetic recombination technology works for various host cells and serves for plant immunity to confer disease resistance on plants as the host.

This sequence represents the cDNA clone pHS2, which encodes a protein having chitinase-activity derived from american elm. This protein inhibits the fungus Ophiostoma ulmi, the causative agent of dutch elm disease. The clone pHs0 used to transform E. coli cells for the recombinant production of the chitinase-like protein. The protein may be used in a composition to inhibit fungal infection of

New isolated banana DNA molecules

Claim 5; Fig 16A-J; 143pp; English

This is the nucleotide sequence of a DNA molecule termed ENDO. The invention provides isolated DNA molecules which are differentially expressed during banama fruit development, and the protein products of these genes. The DNA is selected from a group comprising starch synthase, chitinase, endochitinase, beta-1,3-glucanase, thaumatin-like protein, ascorbate peroxidase, metallothionein, lectin and senescence-related protein. The regulatory elements of the genes can be used to produce chimeric genes for transformation of plants to provide controlled expression of heterologous DNA during fruit development, or in response to exogenous developmental signals, such as ethylene signals. The heterologous protein, e.g. therapeutic protein, can be isolated from the fruit or consumed directly in the transformed fruit. The identity of the present sequence is not given. The entire DNA sequence has been decoded in axevesance the amino acid sequences given in AAY05842-44.

                                                                                                                                                                                                                                                                                                                                                                                                                   This sequence was isolated from a N.tabacum cDNA library following screening with a partial tobacco intracellular chitinase clone. The gene can be inserted into an appropriate plasmid for production of transgenic plants having resistance to fungal pathogens. The sequence was modified so as to obtain apoplast targeting of the protein. G(961) was mutated to a T to create a STOP codon. A second STOP codon was created by mutation of T(968) to A and a Sall restriction site was created by changing T(975) to C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        188 agagccagtgccctggtggtcccacaccccggtggtgggggatctcggcagtatcatct

                                                                                                                                                                                                                                                                                                                                                                                 to construct a transgenic plant in a novel method to produce plants resistant to fungal attack. Such transgenic plants expressing an intracellular plant chitinase gene and a plant beta-1,3-qlucanase gene within its tissues are predicted to exhibit improved resistance to pathogenic fungi. Such genes should be operably linked to promoters and terminators and optionally a gene encoding a selectable or screenable trait. Plants that overexpress the chitinase and glucanase genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            427

The present sequence encodes an extracellular chitinase. The specification describes transgenic plants which express a chitinase gene and a glucanase gene. The expression of the chitinase and beta-1,3-glucanase genes produces an antifungal effect. The transgenic plants are useful for improving plant resistance to pathogenic lungi. The recombinant polynucleotides and the process are useful for producing fungal resistant plants. 55555555**88**

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
